Estimation of Mean and Autocovariance Functions

Stationary processes

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **Review: The Additive Decomposition**

• The additive model for a time series  $\{Y_t\}$  is

$$Y_t = \mu_t + s_t + \eta_t,$$

where

- $\mu_t$  is the trend component
- st is the seasonal component
- $\eta_t$  is the random (noise) component with  $\mathbb{E}(\eta_t) = 0$
- Standard procedure:
  - (1) Estimate/remove the trend and seasonal components
  - (2) Analyze the remainder, the residuals  $\hat{\eta}_t = y_t \hat{\mu}_t \hat{s}_t$
- We will focus on (2) for the next few weeks

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **Time Series Models**

 A time series model is a specification of the probabilistic distribution of a sequence of random variables (RVs) η<sub>t</sub>

(The observed time series is a realization of such a sequence of random variables)

- The simplest time series is i.i.d. (*independent and identically distributed*) noise
  - $\{\eta_t\}$  is a sequence of independent and identically distributed zero-mean (i.e.,  $\mathbb{E}(\eta_t) = 0, \forall t$ ) random variables  $\Rightarrow$  no temporal dependence
  - It is of little value of using i.i.d. noise model to conduct forecast as there is no information from the past observations
  - But, we will use i.i.d. model as a building block to develop time series models that can accommodate time dependence

Stationary processes

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### Example Realizations of i.i.d. Noise

• Gaussian (normal) i.i.d. noise with mean 0 and variance  $\sigma^2 > 0$ 

$$f(\eta_t) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp(-\frac{\eta_t^2}{2\sigma^2})$$

Bernoulli i.i.d. noise with "success" probability

$$\mathbb{P}(\eta_t = 1) = p = 1 - \mathbb{P}(\eta_t = -1)$$

Stationary processes

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **Means and Autocovarainces**

A time series model could also be a specification of the means and autocovariances of the RVs

• The mean function of  $\{\eta_t\}$  is

$$\mu_t = \mathbb{E}(\eta_t).$$

 μ<sub>t</sub> is the population mean at time t, which can be computed as:

$$\mu_t = \begin{cases} \int_{-\infty}^{\infty} \eta_t f(\eta_t) \, d\eta_t & \text{when } \eta_t \text{ is a continuous RV}; \\ \sum_{-\infty}^{\infty} \eta_t p(\eta_t), & \text{when } \eta_t \text{ is a discrete RV}, \end{cases}$$

where  $f(\cdot)$  and  $p(\cdot)$  are the probability density function and probability mass function of  $\eta_t$ , respectively

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **Examples of Mean Functions**

• **Example 1**: What is the mean function for  $\{\eta_t\}$ , an i.i.d.  $N(0, \sigma^2)$  process?

• **Example 2**: For each time point, let  $Y_t = \beta_0 + \beta_1 t + \eta_t$  with  $\beta_0$  and  $\beta_1$  some constants and  $\eta_t$  is defined above. What is  $\mu_Y(t)$ ?

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **Review: The Covariance Between Two RVs**

• The covariance between the RVs X and Y is

$$\mathbb{Cov}(X,Y) = \mathbb{E}\{(X - \mu_X)(Y - \mu_Y)\}\$$
$$= \mathbb{E}(XY) - \mu_X\mu_Y.$$

It is a measure of linear dependence between the two RVs. When X = Y we have

 $\mathbb{Cov}(X, X) = \mathbb{Vor}(X).$ 

• For constants a, b, c, and RVs X, Y, Z:

$$\mathbb{Cov}(aX + bY + c, Z) = \mathbb{Cov}(aX, Z) + \mathbb{Cov}(bY, Z)$$
$$= a\mathbb{Cov}(X, Z) + b\mathbb{Cov}(Y, Z)$$

 $\Rightarrow$ 

$$\begin{aligned} \mathbb{V}ar(X+Y) &= \mathbb{C}av(X,X) + \mathbb{C}av(X,Y) + \mathbb{C}av(Y,X) + \mathbb{C}av(Y,Y) \\ &= \mathbb{V}ar(X) + \mathbb{V}ar(Y) + 2\mathbb{C}av(X,Y) \end{aligned}$$

Stationary processes

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **Autocovariance Function**

• The autocovariance function of  $\{\eta_t\}$  is

$$\gamma(s,t) = \mathbb{Cov}(\eta_s,\eta_t) = \mathbb{E}[(\eta_s - \mu_s)(\eta_t - \mu_t)]$$

It measures the strength of linear dependence between two RVs  $\eta_s$  and  $\eta_t$ 

#### Properties:

- $\gamma(s,t) = \gamma(t,s)$  for each s and t
- When *s* = *t* we have

$$\gamma(t,t) = \mathbb{Cov}(\eta_t,\eta_t) = \mathbb{Cov}(\eta_t) = \sigma_t^2$$

the value of the variance function at time t

•  $\gamma(s,t)$  is a non-negative definite function (will come back to this later)

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **Autocorrelation Function**

• The autocorrelation function of  $\{\eta_t\}$  is

$$\rho(s,t) = \mathbb{Corr}(\eta_s,\eta_t) = \frac{\gamma(s,t)}{\sqrt{\gamma(s,s)\gamma(t,t)}}$$

It measures the "scale invariant" linear association between  $\eta_s$  and  $\eta_t$ 

#### Properties:

- $-1 \le \rho(s,t) \le 1$  for each s and t
- $\rho(s,t) = \rho(t,s)$  for each s and t
- ρ(t, t) = 1 for each t
- $\rho(\cdot, \cdot)$  is a non-negative definite function

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

# Stationarity

• We typically need "replicates" to estimate population quantities. For example, we use

 $\bar{x} = \frac{1}{n} \sum_{i=1}^{n} x_i$ 

to be the estimate of  $\mu_X$ , the population mean of the **single** RV, *X* 

- However, in time series analysis, we have n = 1 (i.e., no replication) because we only have one realized value at each time point
- Stationarity means that some characteristic of {η<sub>t</sub>} does not depend on the time point, t, only on the "time lag" between time points so that we can create "replicates"

Next, we will talk about strict stationarity and weak stationarity

Stationary processes

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **Strictly Stationary Processes**

• A time series,  $\{\eta_t\}$ , is strictly stationary if

 $[\eta_1, \eta_2, \cdots \eta_T] \stackrel{d}{=} [\eta_{1+h}, \eta_{2+h}, \cdots \eta_{T+h}],$ 

for all integers h and  $T \ge 1 \Rightarrow$  the joint distribution are unaffected by time shifts

- Under such the strict stationarity
  - {η<sub>t</sub>} is identically distributed but not (necessarily) independent
  - When  $\mu_t$  is finite,  $\mu_t = \mu$  is independent of time t
  - When the variance function exists,

$$\gamma(s,t) = \gamma(s+h,t+h),$$

for any s, t, and h

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **Weakly Stationary Processes**

- $\{\eta_t\}$  is weakly stationary if
  - $\mathbb{E}(\eta_t) = \mu_t = \mu$
  - $\mathbb{Cov}(\eta_t, \eta_{t+h}) = \gamma(t, t+h) = \gamma(h)$ , finite constant that can depend on h but not on t
- Other names for this type of stationarity include second-order, covariance, wide senese. The quantity h is called the lag
- Weak and strict stationarity
  - A strictly stationary process {η<sub>t</sub>} is also weakly stationary as long as μ is finite
  - Weak stationarity does not imply strict stationarity!

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **Autocovariance Function of Stationary Processes**

The autocovariance function (ACVF) of a stationary process  $\{\eta_t\}$  is defined to be

$$egin{aligned} &\gamma(h) = \mathbb{Cov}(\eta_t, \eta_{t+h}) \ &= \mathbb{E}[(\eta_t - \mu)(\eta_{t+h} - \mu)] \end{aligned}$$

•

which measures the lag-h time dependence

1

# Properties of the ACVF:

- $\gamma(0) = \operatorname{Var}(\eta_t)$
- $\gamma(-h) = \gamma(h)$  for each h
- $\gamma(s-t)$  as a function of (s-t) is non-negative definite

Stationary processes

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **Autocorrelation Function of Stationary Processes**

1

The autocorrelation function (ACF) of a stationary process  $\{\eta_t\}$  is defined to be

$$o(h) = \frac{\gamma(h)}{\gamma(0)}$$

which measures the "scale invariant" lag-h time dependence

Properties of the ACF:

- $-1 \le \rho(h) \le 1$  and  $\rho(0) = 1$  for each h
- $\rho(-h) = \rho(h)$  for each h
- $\rho(s-t)$  as a function of (s-t) is non-negative definite

Stationary processes

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **The White Noise Process**

Let's assume  $\mathbb{E}(\eta_t) = \mu$  and  $\mathbb{Vor}(\eta_t) = \sigma^2 < \infty$ .  $\{\eta_t\}$  is a white noise or  $WN(\mu, \sigma^2)$  process if

$$\gamma(h)$$
 = 0,

for  $h \neq 0$ 

•  $\{\eta_t\}$  is stationary

• However, distributions of  $\eta_t$  and  $\eta_{t+1}$  can be different!

 All i.i.d. noise with finite variance (σ<sup>2</sup> < 0) is white noise but the converse need not be true Stationary processes

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **Examples Realizations of White Noise Processes**

3.17

# The Moving Average Process of First Order (MA(1))

Let  $\{Z_t\}$  be a WN $(0, \sigma^2)$  process and  $\theta$  be some constant  $\in \mathbb{R}$ . For each integer t, let

$$\eta_t = Z_t + \theta Z_{t-1}.$$

- The sequences of RVs {η<sub>t</sub>} is called the moving average process of order 1 or MA(1) process
- One can show that the MA(1) process  $\{\eta_t\}$  is stationary

Stationary processes

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### First-Order Moving Average Process: Mean Function

# Need to show the mean function is NOT a function of time t

$$\mathbb{E}[\eta_t] = \mathbb{E}[Z_t + \theta Z_{t-1}]$$
$$= \mathbb{E}[Z_t] + \theta \mathbb{E}[Z_{t-1}]$$
$$= 0 + \theta \times 0$$
$$= 0, \quad \forall t$$

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### First-Order Moving Average Process: Covariance Function

Need to show the autovariance function  $\gamma(\cdot, \cdot)$  is a function of

$$\gamma(t, t+h) = \mathbb{Cov}(\eta_t, \eta_{t+h})$$
  
=  $\mathbb{Cov}(Z_t + \theta Z_{t-1}, Z_{t+h} + \theta Z_{t+h-1})$   
=  $\mathbb{Cov}(Z_t, Z_{t+h}) + \mathbb{Cov}(Z_t, \theta Z_{t+h-1})$   
+  $\mathbb{Cov}(\theta Z_{t-1}, Z_{t+h}) + \mathbb{Cov}(\theta Z_{t-1}, \theta Z_{t+h-1})$ 

 $\gamma(t,t+h) = \sigma^2 + \theta^2 \sigma^2 = \sigma^2 (1+\theta^2)$ if h = 0, we have if  $h = \pm 1$ , we have  $\gamma(t, t+h) = \theta \sigma^2$ if  $|h| \ge 2$ , we have  $\gamma(t, t+h) = 0$ 

time lag only

 $\Rightarrow \gamma(t, t+h)$  only depends on *h* but not on *t*  $\bigcirc$ 

#### First-Order Moving Average Process: ACVF & ACF

#### ACVF:

$$\gamma(h) = \begin{cases} \sigma^{2}(1+\theta^{2}) & h = 0; \\ \theta \sigma^{2} & |h| = 1; \\ 0 & |h| \ge 2 \end{cases}$$

We can get **ACF** by dividing everything by  $\gamma(0) = \sigma^2(1 + \theta^2)$ 

$$\rho(h) = \begin{cases} 1 & h = 0; \\ \frac{\theta}{1+\theta^2} & |h| = 1; \\ 0 & |h| \ge 2. \end{cases}$$

Stationary processes

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### First-order autoregressive process, AR(1)

Let  $\{Z_t\}$  be a WN $(0, \sigma^2)$  process, and  $-1 < \phi < 1$  be a constant. Let's assume  $\{\eta_t\}$  is a stationary process with

$$\eta_t = \phi \eta_{t-1} + Z_t$$

for each integer *t*, where  $\eta_s$  and  $Z_t$  are uncorrelated for each  $s < t \Rightarrow$  future noise is uncorrelated with the current time point)

We will see later there is only one unique solution to this equation. Such a sequence  $\{\eta_t\}$  of RVs is called an AR(1) process

Stationary processes

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

# Properties of the AR(1) process Want to find the mean value $\mu$ under the weakly stationarity assumption

$$\mathbb{E}[\eta_t] = \mathbb{E}[\phi\eta_{t-1} + Z_t]$$
$$\mu = \phi\mathbb{E}[\eta_{t-1}] + \mathbb{E}[Z_t]$$
$$\mu = \phi\mu + 0$$
$$\Rightarrow \mu = 0, \quad \forall t$$

 $\bigcirc$ Want to find  $\gamma(h)$  under the weakly stationarity assumption

$$\begin{split} \mathbb{C} \mathbb{O} \mathbb{V}(\eta_t, \eta_{t-h}) &= \mathbb{C} \mathbb{O} \mathbb{V}(\phi \eta_{t-1} + Z_t, \eta_{t-h}) \\ \gamma(-h) &= \phi \mathbb{C} \mathbb{O} \mathbb{V}(\eta_{t-1}, \eta_{t-h}) + \mathbb{C} \mathbb{O} \mathbb{V}(Z_t, \eta_{t-h}) \\ \gamma(h) &= \phi \gamma(h-1) + 0 \\ \Rightarrow \gamma(h) &= \phi \gamma(h-1) = \dots = \phi^{|h|} \gamma(0) \end{split}$$

Next, need to figure out  $\gamma(0)$ 

Stationary processes

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### Properties of the AR(1) process Cont'd

 $\begin{aligned} \mathbb{V}ar(\eta_t) &= \mathbb{V}ar(\phi\eta_{t-1} + Z_t) \\ \gamma(0) &= \phi^2 \gamma(0) + \sigma^2 \\ \Rightarrow (1 - \phi^2) \gamma(0) &= \sigma^2 \\ \Rightarrow \gamma(0) &= \frac{\sigma^2}{1 - \phi^2} \end{aligned}$ 

# C Therefore, we have

and

$$\rho(h) = \begin{cases} 1 & h = 0; \\ \phi^{|h|} & h \neq 1. \end{cases}$$

 $\gamma(h) = \begin{cases} \frac{\sigma^2}{1-\phi^2} & h=0;\\ \frac{\phi^{|h|}\sigma^2}{1-\phi^2} & h\neq 1, \end{cases}$ 

Stationary processes

Stationary processes

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **The Random Walk Process**

Let  $\{Z_t\}$  be a WN $(0, \sigma^2)$  process and for  $t \ge 1$  definite

$$\eta_t = Z_1 + Z_2 + \dots + Z_t = \sum_{s=1}^t Z_s.$$

• The sequence of RVs  $\{\eta_t\}$  is called a random walk process

• Special case: If we have  $\{Z_t\}$  such that for each t

$$\mathbb{P}(Z_t = z) = \begin{cases} \frac{1}{2}, & z = 1; \\ \frac{1}{2}, & z = -1; \end{cases}$$

then  $\{\eta_t\}$  is a simple symmetric random walk

• The random walk process is not stationary!

3.27

#### **Example Realizations of Random Walk Processes**

Stationary processes

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

### **Gaussian Processes**

 $\{\eta_t\}$  is a Gaussian process (GP) if the joint distribution of any collection of the RVs has a multivariate normal (aka Gaussian) distribution

• The distribution of a GP is fully characterized by  $\mu(\cdot)$ , the mean function, and  $\gamma(\cdot, \cdot)$ , the autocovariance function. The joint probability density function of  $\eta = (\eta_1, \eta_2, \dots, \eta_T)^T$  is

$$f(\boldsymbol{\eta}) = \frac{1}{(2\pi)^{\frac{T}{2}} |\Sigma|^{\frac{1}{2}}} \exp\left(-\frac{1}{2}(\boldsymbol{\eta} - \boldsymbol{\mu})^T \Sigma^{-1}(\boldsymbol{\eta} - \boldsymbol{\mu})\right),$$

where  $\mu = (\mu_1, \mu_2, \dots, \mu_T)^T$  and the (i, j) element of the covariance matrix  $\Sigma$  is  $\gamma(i, j)$ 

 If a GP {η<sub>t</sub>} is weakly stationary then the process is also strictly stationary

Mean and Autocovaraince Functions

Stationarity

Some Examples of Stationary Processes

#### **Estimating the Mean of Stationary Processes**

Let  $\{\eta_t\}$  be stationary with mean  $\mu$  and ACVF  $\gamma(s,t) = \gamma(s-t)$ 

• A natural estimator of  $\mu$  is the sample mean

$$\bar{\eta} = \frac{1}{T} \sum_{t=1}^{T} \eta_t.$$

 $\bar{\eta}$  is an unbiased estimator of  $\mu$ , i.e.

• Since  $\{\eta_t\}$  is stationary, we have

$$\begin{split} \mathbb{V}\text{or}(\bar{\eta}) &= \frac{1}{T^2} \mathbb{V}\text{or}\left(\sum_{i=1}^T \eta_t\right) \\ &= \frac{1}{T^2} \sum_{s=1}^T \sum_{t=1}^T \mathbb{C}\text{ov}(\eta_s, \eta_t) \\ &= \frac{1}{T^2} \sum_{s=1}^T \sum_{t=1}^T \gamma(s-t) \end{split}$$

Exercise: Show

$$\operatorname{Vor}(\bar{\eta}) = \frac{1}{T} \sum_{h=-(T-1)}^{T-1} \left(1 - \frac{|h|}{T}\right) \gamma(h)$$
